WEB DEVELOPMENT PROJECT

GAMING WEBSITE

1. Introduction

The Gaming Website is a multi-page website developed using HTML and CSS. It provides a central place for visitors to explore popular games, view upcoming gaming tournaments, check a sample player leaderboard, and contact the website team. The design uses a dark gaming-style background with bright aqua and magenta accents to create a modern gaming atmosphere.

The website contains five connected pages: Home, Games, Tournaments, Leaderboard, and Contact. A common navigation menu helps users move between the pages. Game cards include images, short descriptions, and links to official game websites. The project demonstrates the structure and styling of a simple static website.

2. Aim

To design and develop a responsive, user-friendly gaming website using HTML and CSS, with separate pages for game exploration, tournament information, player rankings, and contact details.

3. Objectives

- Create a home page that introduces the Gaming Zone and links to the main sections.
- Display a collection of games with images, descriptions, categories, and external links.
- Present sample upcoming tournaments with dates, modes, entry fees, and registration status.
- Show a sample leaderboard containing player ranks, games, and points.
- Provide contact information and a contact form layout.
- Use CSS for colors, typography, spacing, cards, navigation, and responsive layouts.
- Practice organizing a website into multiple linked HTML files and reusing a consistent visual style.

4. HTML Concepts

- **HTML document structure:** The pages use <!DOCTYPE html>, <html>, <head>, and <body> to define a standard HTML document.
- **Metadata and title:** The <meta charset> and viewport settings support character encoding and responsive display; <title> names each page.
- **Semantic elements:** <header>, <nav>, <main>, <section>, <article>, and <footer> organize content into meaningful regions.

- **Headings and paragraphs:** <h1> to <h3> and <p> provide a clear content hierarchy and readable text.
- **Links:** <a> elements connect the five local pages and link to external game websites.
- **Images and alternative text:** <img> elements display the gaming artwork, and alt text describes images for accessibility.
- **Lists and tables:** Lists show tournament rules; the leaderboard uses a table with header and data cells.
- **Forms and inputs:** The Contact page contains labels, text/email inputs, a textarea, and a submit button.
- **Attributes and identifiers:** Attributes such as href, src, alt, class, id, name, required, and datacategory control behavior and presentation.

5. CSS Concepts

- **Selectors:** Element, class, ID, attribute, and pseudo-class selectors apply styles to specific page elements.
- **Colors and backgrounds:** Dark navy backgrounds, aqua borders, magenta links, and translucent panels create a consistent gaming theme.
- **Box model:** Margins, padding, borders, and border-radius control spacing and the shape of content cards.
- **Flexbox:** Flex layouts arrange tournament cards and contact content and allow items to wrap when needed.
- **CSS Grid:** The Games page uses a grid for game cards, with column changes at smaller screen widths.
- **Hover and active states:** Hover styles provide feedback on navigation links, buttons, and filter labels.
- **Responsive design:** Media queries adjust layouts for mobile-sized screens.
- **Image sizing:** Width, height, object-fit, and border-radius keep game artwork inside consistent image areas.
- **CSS-only filtering:** Radio inputs and sibling selectors filter game cards by categories without JavaScript.
- **Typography:** Font families, sizes, weights, and line heights improve readability and visual hierarchy.

6. Procedure

1. Collect and organize the background and game image assets in the project folder.
2. Create index.html as the home page and add the shared navigation links.
3. Create games.html and add game cards with images, descriptions, category labels, and official website links.
4. Create tournaments.html and add tournament cards and a list of basic rules.
5. Create leaderboard.html and build a table containing sample ranks, player names, games, and points.
6. Create contact.html and add contact details plus a contact form layout.
7. Write CSS rules for the page background, navigation, cards, typography, borders, buttons, and responsive behavior.
8. Keep the HTML files and referenced image files in the same project directory so relative paths work correctly.
9. Open index.html in a web browser and test all navigation links, game filters, external links, and page layouts.

10. Review the pages at different window sizes and correct any layout or image-path issues.

7. Source Code

The following source-code listings are based on the HTML files supplied for this project. Each file includes its own HTML structure and embedded CSS styles.

index.html

8. Output Screenshots

The browser output screenshots were not provided for this document. The project contains five pages whose browser outputs can be captured and inserted in this section when available.

Home Page (index.html)

Expected output: Displays the Gaming Zone welcome section and links to the main pages.

[Insert browser screenshot here if required]

Games Page (games.html)

Expected output: Displays the game library and category filters.

[Insert browser screenshot here if required]

Tournaments Page (tournaments.html)

Expected output: Displays tournament cards and basic rules.

[Insert browser screenshot here if required]

Leaderboard Page (leaderboard.html)

Expected output: Displays sample player rankings and points.

[Insert browser screenshot here if required]

Contact Page (contact.html)

Expected output: Displays contact details and a message form.

[Insert browser screenshot here if required]

9. Conclusion

The Gaming Website project demonstrates how HTML and CSS can be used to build a multi-page website with a consistent design. It includes game information, tournament details, a sample leaderboard, and a contact page. The project applies semantic HTML, navigation links, forms, tables, CSS Grid, Flexbox, hover effects, and media queries. Testing the website in a browser helps verify that the pages and local assets work as intended. This project provides a practical foundation for further improvements, such as adding a database, real player scores, tournament registration, and server-side form handling.
